[1].

favorable conditions for living, growth and development of the population of the studied species are created there. These conditions show that the fodder base, feed composition and conditions of hibernation, and also the composition of the ground entirely meet the requirements of biology and ecology of the steppe marmots, and also foster increase of marmots' population on the territory of Akmola region and other neighboring areas.

The conditions of expansions of the area of natural habitat of the steppe marmot were created in the National Park.
